TRACK SYSTEMS

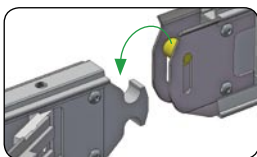

Frames

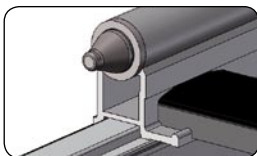

Produced with our constant concern for quality, KGS Development foldable frames are very useful for laying long dolly tracks over rough terrain. They allow adjustment time to be reduced significantly due to the rigidity of their structure and a unique coupling system. (Patent pending)

The male/female connectors automatically position the frames precisely in all types of conditions.

This system of symmetrical connections (Patent pending) allows frames to be joined without taking their direction into account.

The frame profile is designed to be fixed to our Tracks and Monotracks with maximum safety.

The stackable profiles allow load bearing to be increased, thus reducing space needed for storage and protecting the hinges during handling.

The foldable frames are available with 3 different wheel-bases (620, 880 and 1000 mm) and in 2 different lengths: 4 m and 2 m.
